

IN THE CLAIMS

1. (Previously Presented) A method, comprising:

indicating to two or more remote systems in a distributed data processing system that a task, in a task list, is available for processing based on a distribution list, wherein the task is a compilation task and wherein an indication specifies at least one resource requirement;

receiving at least one response from each of at least two of the two or more remote systems capable of performing the task responsive to receiving the indication, wherein the at least one response is based on a determination by the two or more remote systems that the at least one resource requirement is satisfied, and wherein each of the responding remote systems has reserved at least a portion of its respective resources for performing the task based at least in part on the at least one resource requirement; and

assigning the task from the task list to a remote system of the at least two remote systems that responds first to the indication that the task is available for processing, and wherein assigning the task is performed without comparing operational capabilities of the at least two remote systems to each other.

2. (Previously Presented) The method of claim 1, wherein the distribution list comprises destination addresses associated with the two or more remote systems, wherein indicating to the two or more remote systems comprises providing a message to a router that, responsive to the message, transmits at least a portion of the message to a plurality of the remote systems based on the distribution list.

3. (Previously Presented) The method of claim 1, wherein indicating to the two or more remote systems comprises indicating a threshold criterion that the two or more remote systems should satisfy, and wherein receiving the at least one response comprises receiving the at least one response from the at least two remote systems that satisfy the threshold criterion.

4. (Previously Presented) The method of claim 3, wherein indicating the threshold criterion comprises indicating at least one of a preselected processing speed, memory size, and network speed for the one or more remote systems.

5. (Previously Presented) The method of claim 3, wherein receiving the at least one response comprises receiving configuration information associated with the at least two of the two or more remote systems, and wherein the first remote system to respond refers to at least one of a first remote system to generate a response and a first remote system to have its response received.

6. (Original) The method of claim 5, wherein receiving the configuration information comprises receiving information including at least one of a processing speed, memory size, network speed, and load level associated with the one or more remote systems.

7. (Cancelled).

8. (Previously Presented) The method of claim 1, wherein the distribution list is a multicast list, and wherein indicating to the two or more remote systems comprises providing a message to a router that, responsive to the message, transmits, via multicast, at least a portion of the message to a plurality of the remote systems based on the distribution list.

9. (Previously Presented) The method of claim 1, wherein the act of indicating comprises indicating that the compilation task is available for processing.

10. (Previously Presented) An article comprising one or more machine-readable storage media containing instructions that when executed enable a processor to:

indicate to two or more remote systems in a distributed data processing system that a task in a task list is available for processing based on a distribution list identifying the remote systems, wherein the task is a compilation task and wherein the indication specifies at least one resource requirement; and

assign, based on a determination by the two or more remote systems that at least one or more of the resource requirements is satisfied, the task from the task list to a first remote system to respond to the indication that the task is available for processing, wherein the task is assigned without performing a comparison of current operational capabilities of the two or more remote systems to each other, and wherein each of the two or more remote systems has reserved at least a portion of its respective resources for performing the task based at least in part on the at least one resource requirement.

11. (Previously Presented) The article of claim 10, wherein the task is a compilation task, and wherein the instructions when executed enable the processor to allow at least two of the two or more remote systems based on a selection scheme.

12. (Original) The article of claim 11, wherein the instructions when executed enable the processor to allow that remote system which responds first to perform the task.

13. (Currently Amended) The article of claim 11, wherein the instructions when executed enable the processor to allow the remote system having ~~at least one of a specified processing speed and~~ a desirable past performance to perform the task, wherein past performance comprises at least one of a past completed compilation task and a project compilation basis.

14. (Previously Presented) The article of claim 11, wherein the instructions when executed enable the processor to allow two or more remote systems to perform the task in response to determining that a number of responding remote systems exceed a number of available tasks.

15. (Previously Presented) The article of claim 11, wherein the instructions when executed enable the processor to receive responses from at least one of the two or more the remote systems, wherein the response includes configuration information associated with the one or more remote systems.

16. (Previously Presented) The article of claim 10, wherein the instructions when executed enable the processor to multicast a request to the two or more remote systems coupled to a network that the task is available for processing.

17. (Original) The article of claim 10, wherein the instructions when executed enable the processor to receive results from the at least one remote system that is allowed to perform the task.

18. (Previously Presented) An apparatus, comprising:

means for indicating to two or more remote systems in a distributed data processing compilation system that a task in a task list is available for processing based on a distribution list identifying the two or more remote systems and wherein the means for indicating specifies at least one resource requirement;

means for receiving at least one response from each of the two or more remote systems capable of performing the task based on the indication, wherein the at least one response is based on a determination by the two or more remote systems that the at least one resource requirement is satisfied, and wherein each of the responding remote systems has reserved at least a portion of its respective resources for performing the task based at least in part on the at least one resource requirement; and

means for assigning the task from the task list to a first remote system of the two or more remote systems to respond to the indication that the task is available for processing, and wherein means for assigning the task comprises assigning without comparing operational capabilities of the two or more remote systems to each other.

19. (Previously Presented) An apparatus, comprising:

an interface adapted to communicate with two or more remote systems; and

a control unit communicatively coupled to the interface, the control unit adapted to:

indicate to the two or more remote systems in a distributed data processing compilation system that a task in a task list is available for processing based on a distribution

list identifying the two or more remote systems, wherein the indication specifies at least one resource requirement;

receive at least one response from the two or more remote systems capable of performing the task based on the indication, wherein the at least one response is based on a determination by the two or more remote systems that the at least one resource requirement is satisfied, and wherein each responding remote system has reserved at least a portion of its respective resources for performing the task based at least in part on the at least one resource requirement; and

assign the task from the task list to a first remote system to respond to the indication that the task is available for processing, wherein the task is assigned without performing a comparison of operational capabilities of the two or more remote systems to each other.

20. (Previously Presented) The apparatus of claim 19, wherein the task is a compilation task, wherein the control unit is adapted to send a multicast message to a plurality of the two or more remote systems on a network that a compilation task is available, and wherein the multicast message is sent to a multicast address on a router which in turn completes the multicast.

21. (Previously Presented) The apparatus of claim 20, wherein the control unit is adapted to indicate a threshold criterion that the two or more remote systems should satisfy and further adapted to receive the at least one response from the two or more remote systems that satisfy the threshold criterion.

22. (Previously Presented) The apparatus of claim 21, wherein the control unit is adapted to indicate at least one of a minimum processing speed, memory amount, and network speed for the one or more remote systems.

23. (Previously Presented) The apparatus of claim 21, wherein the control unit is adapted to receive configuration information associated with the two or more remote systems.

24. (Original) The apparatus of claim 23, wherein the control unit is adapted to receive information including at least one of a processing speed, memory size, network speed, and load level associated with the one or more remote systems.

25. (Previously Presented) The apparatus of claim 24, wherein the control unit is adapted to allow at least two of the two or more remote systems to perform the task based on a selection scheme.

26. (Original) The apparatus of claim 25, wherein the selection scheme comprises allowing a remote system that responds first to perform the compilation task.

27. (Original) The apparatus of claim 25, wherein the selection scheme comprises allowing a remote system to perform the compilation task based on the received configuration information.

28. (Previously Presented) The apparatus of claim 19, wherein the control unit is adapted to identify the task that is available for processing in a queue that is accessible by two or more of the remote systems.

29. (Previously Presented) A distributed compilation system, comprising:
two or more remote systems;
a client system adapted to:

indicate to the two or more remote systems that a compilation task in a task list is available for processing based on a distribution list identifying the one or more remote systems, wherein the indication specifies at least one resource requirement;

receive at least one response from at least two of the two or more remote systems capable of performing the compiling task based on the indication wherein the at least one response is based on a determination by at least two of the two or more remote systems that the at least one resource requirement is satisfied, and wherein each responding remote system has reserved at least a portion of its respective

resources for performing the task based at least in part on the at least one resource requirement; and

assign the task from the task list to a first remote system to respond to the indication that the task is available for processing, wherein the task is assigned without performing a comparison of operational capabilities of at least two of the two or more remote systems to each other.

30. (Original) The distributed compilation system of claim 29, wherein the client system multicasts a message to the one or more remote networks over a data network.

31. (Previously Presented) The distributed compilation system of claim 29, wherein at least one of the one or more remote systems is adapted to:

detect an indication from the client system that a compilation task is available for processing;

determine if the at least one remote system is capable of processing the compilation task; and

process the compilation task for the client system in response to determining that at least one remote system is capable of processing the compilation task.

32. (Previously Presented) A method, comprising:

detecting an indication from a client system to process one or more compilation tasks, wherein the indication specifies at least one resource requirement;

determining if a remote system of a plurality of remote systems that detects the indication is capable of processing at least one of the one or more compilation tasks in response to detecting the indication from the client system, wherein the determination takes place at the remote system;

reserving one or more resources of the remote system in response to determining that the remote system is capable of processing the at least one of the one or more compilation task, wherein the reserving takes place at the remote system;

responding first to the indication, wherein responding is performed by the remote system; and

processing the at least one compilation task for the client system in response to at least one or more of the compilation tasks from the client system being assigned to the remote system, wherein the task is assigned without performing a comparison of operational capabilities of the remote system and the plurality of remote systems.

33. (Previously Presented) The method of claim 32, wherein the indication was based on a distribution list identifying the one or more remote systems, and wherein the request from the client system was a multicast request, further comprising providing results of the processing to the client system.

34. (Original) The method of claim 32, wherein the processing comprises accessing a queue associated with the client system and determining the compilation task to process.

35. (Previously Presented) A method, comprising:

indicating to two or more remote systems in a distributed data processing system that a task in a task list is available for processing, wherein the indication specifies at least one resource requirement;

receiving at least one response from the two or more remote systems capable of performing the task responsive to receiving the indication wherein the at least one response is based on a determination by the two or more remote systems that the at least one resource requirement is satisfied, and wherein each of the responding remote systems has reserved at least a portion of its respective resources for performing the task based at least in part on the at least one resource requirement; and

assigning the task from the task list to a first remote system to respond to the indication that the task is available for processing, and wherein assigning the task is performed without comparing operational capabilities of the two or more remote systems.

36. (Previously Presented) The method of claim 35, wherein the distributed system is a distributed compilation system, and wherein indicating comprises indicating to the two or more remote systems that a compilation task is available for processing, wherein the indication was based on a distribution list identifying the two or more remote systems, and wherein the request from the client system was a multicast request, and further wherein receiving the at least one response comprises receiving the at least one response from the two or more remote systems capable of performing the compilation task responsive to receiving the indication.

37. (Previously Presented) The method of claim 35, wherein the task is at least one of a compilation task, a video processing task, audio processing task, image processing task, encryption task, and decryption task.
